## INTRODUCTION

During our PoC phase or your basic testing, there are sometimes some troubles or questions on how-to configure your load-balancer ...

There is a simple way to avoid misconfiguration for HAProxy config file or HyperBalance configuration (typo error, port numbers, etc.) during installation for PoC and test (SE tool or tool provided to a customer) or multi-automated-installation via Vagrant.

This document will show you the HyperBalance details.

### # Disclaimer / Warning

Use this tool with precautions (review the config file created manually for a double-check) for your environment : it is not an official tool supported by Cloudian.

Cloudian can **NOT** be involved for any bugs or misconfiguration due to this tool. So you are using it at your own risks and be aware of the restrictions.

## GOAL OF THE DOCUMENT

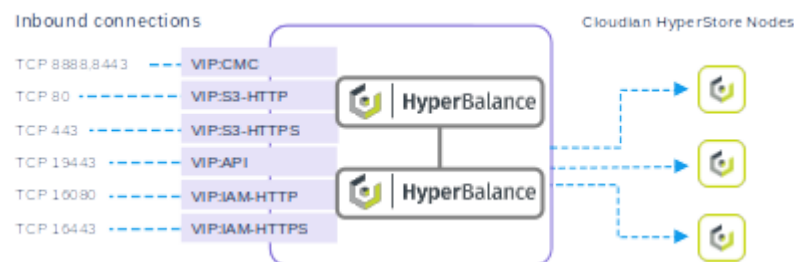

This document introduces a How-To configuration for the HyperBalance appliance on top of HyperStore.

The goal is to build a HyperBalance configuration file based on the information already in place in a fresh installation of a Clouidian cluster.

The result is a config file for a dedicated load-balancer (1 host or 1 VM) to Clouidian cluster pushed directly to the load-balancer (no GSLB configuration, HA config should be coming soon).

## ARCHITECTURE EXAMPLE

Starting on One-Arm or Two-Arm topologies, the design is similar to the drawing below.

In this document, we will show you an example on the same local subnet (Front-End) but with 3 IPs for the HyperBalance :

- 1 for the primary LB
- 1 for the secondary LB
- 1 for Clouidian - floating IP

## REQUIREMENTS AND RESTRICTIONS

### PREREQUISITES

The HyperBalance python tool is configured to work with **7.4.x** releases and upper (already tested on **HS 7.5**)

The HyperBalance OVA is imported and deployed matching the prerequisites of the LB.org documentation. You must run the setup script and configure at least the IP for the GUI (login/password as well).

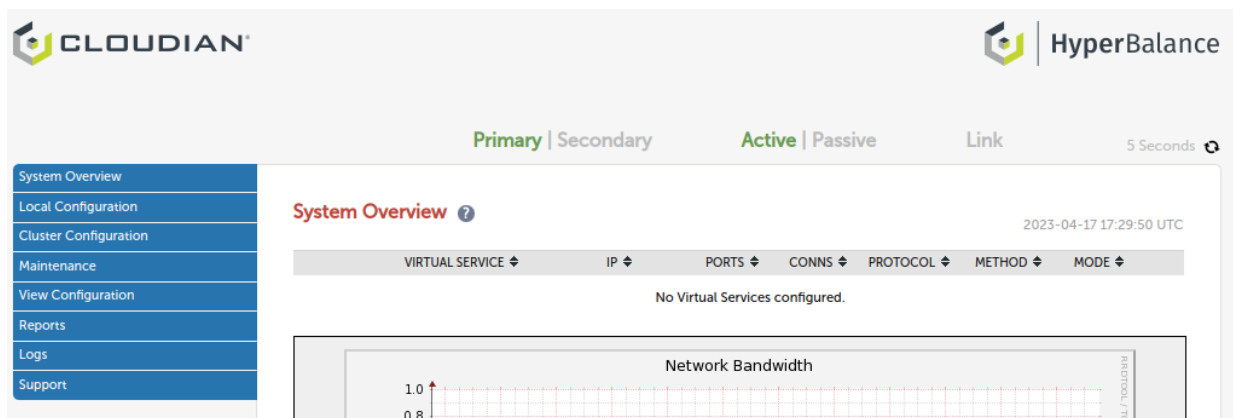

We are supposing for the rest of the documentation, that your LB is connected to a network reachable by the Cloudian nodes with SSH protocol (port 22).

### PREAMBLE

We are using the latest release of HyperBalance for April 2023.

You should have something similar to the picture below : **no LB configuration except the basic needs.**

**Please avoid to change or manage anything in the HyperBalance configuration before creating the configuration with the tool (especially the High Availability configuration).**

*We recommend first to create the configuration with this tool and then the HA configuration propagating the new configuration safely.*

## FIRST STEP - ON LBS

The Python tool can automatically configure the LB but we have to allow it. So, we must change the security parameters.

Login on the LB, go to “Local Configuration” → “Security” → Change the “Appliance Security Mode” to “Custom” :

Cloudian HyperBalance

Primary | Secondary Active | Passive Link 46 Seconds

System Overview Local Configuration 1 Hostname & DNS Network Interface Configuration Routing SSH Keys System Date & Time Physical - Advanced Configuration Portal Management Security 2 SNMP Configuration Graphing Licence Key Execute shell command Cluster Configuration Maintenance

### Appliance Security Options

Appliance Security Mode	Custom	?
Disable Console Access	<input checked="" type="checkbox"/>	?
Disable SSH Password Access	<input checked="" type="checkbox"/>	?
Web User Interface via HTTPS only	<input checked="" type="checkbox"/>	?
HTTPS Port for Web User Interface	9443	?
Web Interface SSL Certificate	Default Self Signed Certificate	?
Ciphers to use	ECDHE-ECDSA-AES256-GCM	?

Update

Next, uncheck the “Disable SSH password access” to allow our python tool to send the configuration we want via SSH. Don’t forget to “Update” the configuration on the LB.

Cloudian HyperBalance

Primary | Secondary Active | Passive Link 55 Seconds

System Overview Local Configuration Hostname & DNS Network Interface Configuration Routing SSH Keys System Date & Time Physical - Advanced Configuration Portal Management Security SNMP Configuration Graphing Licence Key Execute shell command Cluster Configuration Maintenance

### Appliance Security Options

Appliance Security Mode	Custom	?
Disable Console Access	<input checked="" type="checkbox"/>	?
Disable SSH Password Access	<input type="checkbox"/>	?
Web User Interface via HTTPS only	<input checked="" type="checkbox"/>	?
HTTPS Port for Web User Interface	9443	?
Web Interface SSL Certificate	Default Self Signed Certificate	?
Ciphers to use	ECDHE-ECDSA-AES256-GCM	?

2 Update

The result should be similar to this :

The screenshot shows the Cloudian HyperBalance web interface. On the left is a navigation menu with categories: System Overview, Local Configuration (selected), Cluster Configuration, Maintenance, View Configuration, and Reports. Under Local Configuration, 'Security' is highlighted. The main content area has a top bar with 'Primary | Secondary', 'Active | Passive', 'Link', and a '3 Seconds' refresh timer. A green banner at the top of the main area says 'Information: Security configuration successfully updated'. Below this is the 'Appliance Security Options' section, which contains a table of settings:

Appliance Security Mode	Custom	?
Disable Console Access	<input checked="" type="checkbox"/>	?
Disable SSH Password Access	<input type="checkbox"/>	?
Web User Interface via HTTPS only	<input checked="" type="checkbox"/>	?
HTTPS Port for Web User Interface	9443	?
Web Interface SSL Certificate	Default Self Signed Certificate	?
Ciphers to use	ECDHE-ECDSA-AES256-GCM	?

An 'Update' button is located at the bottom right of the configuration table.

You should have two load-balancers, so apply the same configuration to your 2nd LB appliance please.

We are done for the LB part now. Proceed to the second step in the next chapter.

*We can disable again the SSH password access after the configuration applied if that matches your security rules.*

Again, **DO NOT** configure the High Availability feature (or something else). The HyperBalance configuration must be basically what we configured until now.

## SECOND STEP - ON PUPPET MASTER NODE

### DOWNLOAD THE PYTHON TOOL OR UPLOAD IT ON THE PUPPET MASTER

Download the last zip archive from the Github repository and upload it to the Clodian puppet master for example.

command line :

```
wget https://github.com/pitdive/haproxy_config/archive/refs/heads/master.zip -O haproxy_config.zip
```

Example :

```
# wget
https://github.com/pitdive/haproxy_config/archive/refs/heads/master.zip -O
haproxy_config.zip
...
2022-09-26 15:37:30 (1.15 MB/s) - 'haproxy_config.zip' saved [14475]
```

Extract the files and go to the directory :

```
[root@cloudlab01 ~]# unzip -qqo ./haproxy_config.zip
[root@cloudlab01 ~]# cd haproxy_config-master/
[root@cloudlab01 haproxy_config-master]# ls
haproxy_config.py  haproxy_config_template.cfg  HyperBalance_How-to.pdf
README.md
```

## USING THE HAPROXY\_CONFIG TOOL

First run, try to have the HELP informations (if needed) :

```
[root@cloudlab01 haproxy_config-master]# python ./haproxy_config.py --help
usage: haproxy_config.py [-h] [-s SURVEY] [-i INSTALL] [-c COMMON] [-f FOLDER]
                        [-hb] [-hbr] [-bs3 BACKUPS3] [-ms MAILSERVER]
                        [-mf MAILFROM] [-mt MAILTO]

parameters for the script

optional arguments:
  -h, --help            show this help message and exit
  -s SURVEY, --survey SURVEY
                        indicate the survey file, default = survey.csv
  -i INSTALL, --install INSTALL
                        indicate the installation file, default =
                        CloudianInstallConfiguration.txt
  -c COMMON, --common COMMON
                        indicate the common.csv file, default = common.csv
  -f FOLDER, --folder FOLDER
                        indicate the folder including all config files,
                        default = local folder
  -hb, --hyperbalance   specify you want to create a HyperBalance
                        configuration
  -hbr, --hbrevert      revert the hyperbalance config applied
  -bs3 BACKUPS3, --backups3 BACKUPS3
                        indicate the DC in backup/stand-by mode for s3,
                        default=none
  -ms MAILSERVER, --mailserver MAILSERVER
                        mail server name or @IP for alerts
  -mf MAILFROM, --mailfrom MAILFROM
                        indicate the sender, default = haproxy@localhost
  -mt MAILTO, --mailto MAILTO
                        indicate the recipient, default = root@localhost
```

For this case, we are interested about the options :

- -hb or --hyperbalance
- -hbr or --hbrevert

Do **NOT** run the tool without one of the above options or you will create a HAProxy configuration and not HyperBalance one (which is different !).

if you are ready and your hyperbalance as well, let's try to create the configuration automatically with the command line :

**# python ./haproxy\_config.py --hyperbalance**

*Notice : In the example below, we are using the @IP : 192.168.110.199 for the primary LB, 192.168.110.198 for the secondary LB and the @IP : 192.168.110.200 as the floating IP.*

```
[root@cloudlab01 ~]# python ./haproxy_config.py --hyperbalance
You requested a configuration for : HyperBalance appliance

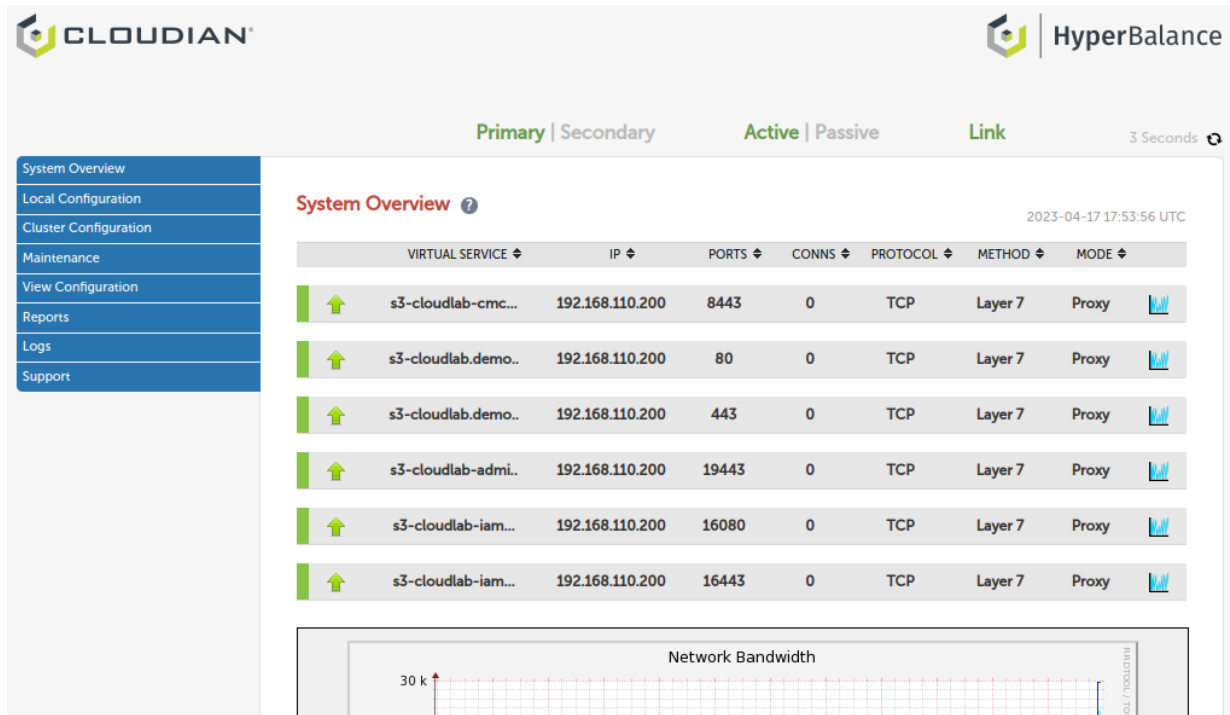

We are considering the following path as the current path for the cloudian
installation : /opt/cloudian-staging/7.5.1/
/opt/cloudian-staging/7.5.1/survey.csv --> FOUND - OK
/opt/cloudian-staging/7.5.1/CloudianInstallConfiguration.txt --> FOUND - OK
/etc/cloudian-7.5.1-puppet/manifests/extdata/common.csv --> FOUND - OK

HyperStore release detected : 7.5.1
You need to have the root access.
Please, enter the IP address of your Primary HyperBalance appliance : 192.168.110.199
Enter the root password for the connection ...
Password: *****
Trying to connect to the host : 192.168.110.199 with the root password ... and then
checking some parameters for you ...
processing, please wait...
OK. HyperBalance * Primary * is reachable...
Please enter the IP address for the Secondary (or leave empty) :192.168.110.198
processing, please wait...
OK. HyperBalance * Secondary * is reachable...

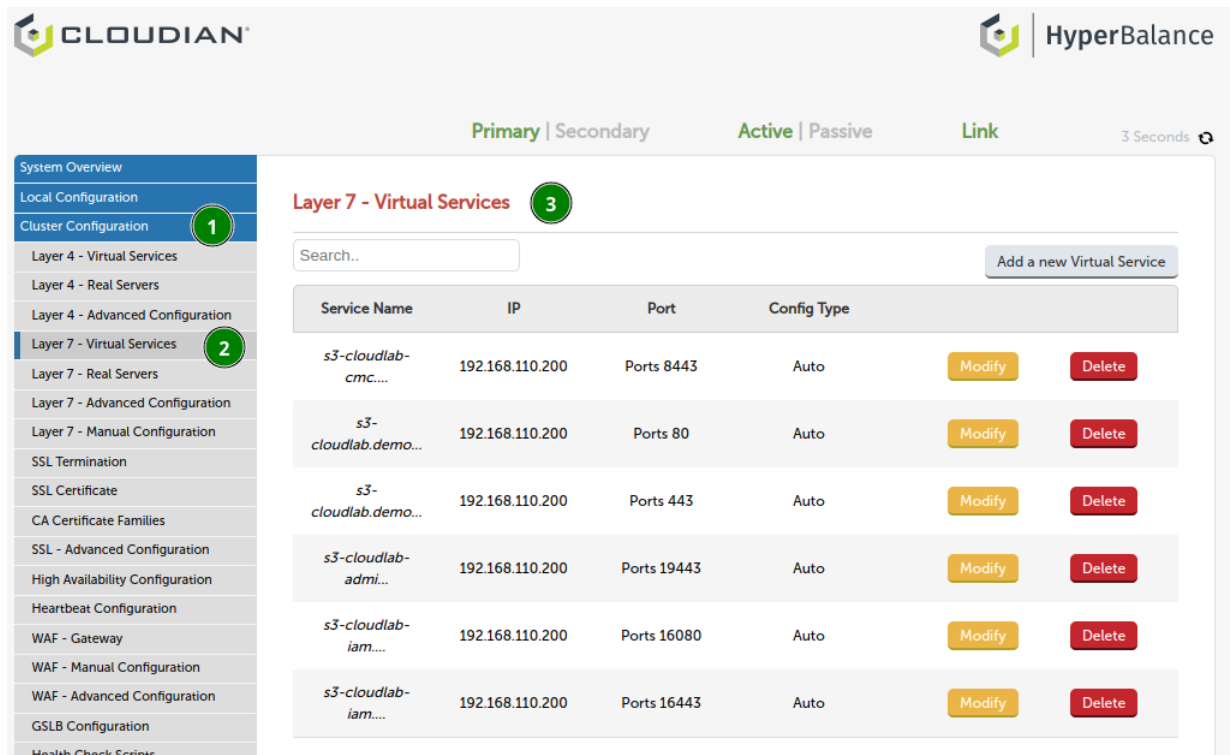

Please, enter the IP address for the VIP (floating IP) : 192.168.110.200
Building the configuration
processing, please wait...
Backup Primary config
processing, please wait...
Backup Secondary config
processing, please wait...
HyperBalance configuration is applied.
HA configuration in progress
processing, please wait...
HA pair created.
processing, please wait...
Heartbeat restarted on primary.
processing, please wait...
Heartbeat restarted on secondary.
processing, please wait...
HA is fully configured.
[root@cloudlab01 ~]#
```

**Notice : you have to wait for a couple of minutes during the HA pair creation process, it's normal and due to the HA checking process : heartbeat sync. Be patient please.**

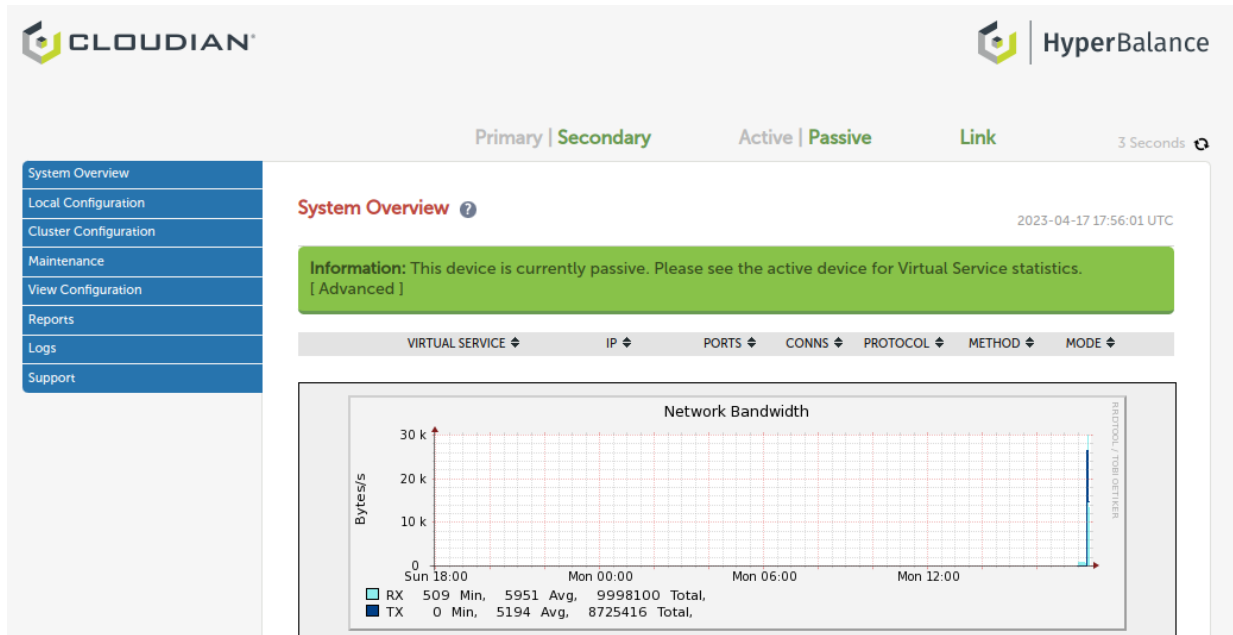

Take a look at the primary LB GUI, we should have 6 virtual services created and ready to serve requests.

The virtual Services are up and running with the standard configuration from the Cloudian nodes.

The secondary LB GUI looks configured as well but as Secondary and Passive LB for the moment.

## WANT TO REVERT THE CONFIGURATION ?

For any reason, you want to revert the configuration pushed on the LB, no problem, use the revert command. **You must be in the same folder used for the initial configuration.**

```
[root@cloudlab01 ~]# python ./haproxy_config.py --hbrevert
YOU ARE REQUESTING TO REVERT THE CONFIGURATION
You need to have the root access.
Please, enter the IP address of your Primary HyperBalance appliance : 192.168.110.199
Enter the root password for the connection ...
Password:
Trying to connect to the host : 192.168.110.199 with the root password
... and then checking some parameters for you ...
processing, please wait...
OK. HyperBalance * Primary * is reachable...
Please enter the IP address for the Secondary (or leave empty) :192.168.110.198
processing, please wait...
OK. HyperBalance * Secondary * is reachable...
Could you confirm the REVERT action please (restart is mandatory) ? (yes / no) : yes
lb_config_primary.xml --> FOUND - OK
processing, please wait...
Primary config restored
lb_config_secondary.xml --> FOUND - OK
processing, please wait...
Secondary config restored
--> Pair broken, restart needed ...
processing, please wait...
Running restart for the appliance : secondary.
processing, please wait...
Running restart for the appliance : primary.
[root@cloudlab01 ~]#
```

Then, if you check your HyperBalancer GUI, everything is clear : no more real servers, no more virtual services. The tool targets only the Cloudian standard configuration applied by itself previously :

- virtual services : CMC, S3, Admin API, IAM
- floating IP for Cloudian

Primary | Secondary

Active | Passive
